Gridded Population of the World (GPW) version 3

Overview

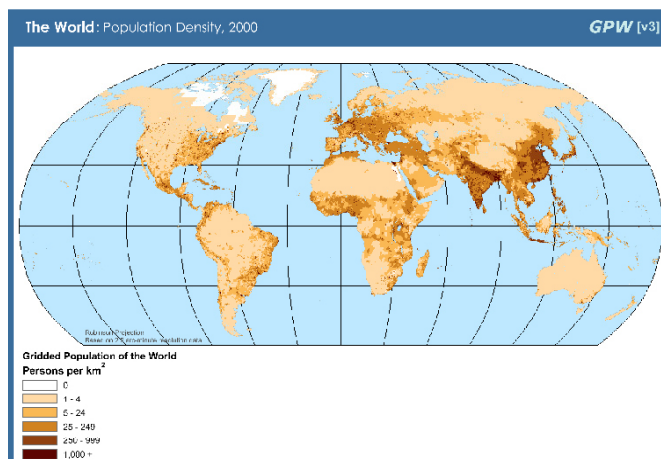

Data on population dynamics and distribution are key to understanding human interaction with the environment and possible responses to global environmental change.

Developed in partnership with the International Tropical Agriculture Center (CIAT), *The Gridded Population of the World (GPW) version 3* is a unique global demographic data set that depicts the distribution of human population across the globe by converting census data to grids. It is the most accurate version of *GPW* to date, with more than three times the amount of input data as version two, and twenty times the input data of the original version.

Data

Go to <http://sedac.ciesin.columbia.edu/gpw> for maps, documentation, and data. The global demographic data set provides consistent population and population density estimates referenced to a grid of 2.5 minute X 2.5 minute latitude-longitude quadrilateral cells, for 1990–2000 five-year increments. Projections to 2015 are also available.

Data are available for download at global, regional, and country levels in three grid formats: ArcInfo, Band Interleaved by Line (BIL), and ASCII. Extensive data quality information is available for each country, including source information, the number of subnational census units used for gridding, and comparisons between *GPW* and UN national totals.

Project Highlights

- The population data estimates are provided for 1990, 1995, and 2000. Extrapolations are provided through 2015.
- The map collection is greatly expanded to include population density, population counts, and sub-national administrative boundary maps at country, continental, and global levels.
- More than two-thirds of the countries have more recent input data than version two.
